Preface xiii

Acknowledgements xvi

1 Introduction 1
1.1 History and overview . . . 2
1.2 The circle method: Fourier analysis on $\mathbb{Z}$ . . . 6
1.3 The major arcs . . . 9
1.3.1 What do we know about L-functions and their zeros? . . . 9
1.3.2 Part IV: main issues and procedure . . . 11
1.3.3 Reader's guide to Part IV . . . 15
1.4 The minor arcs . . . 16
1.4.1 Qualitative goals and main ideas . . . 16
1.4.2 Combinatorial identities: possibilities and choices . . . 18
1.4.3 Reader's guide to Part III . . . 21
1.5 Integrals over major and minor arcs . . . 24
1.5.1 Reader's guide to Part V . . . 25

I Groundwork 28

2 Notation and preliminaries 29
2.1 General notation . . . 29
2.1.1 Basic functions on $\mathbb{Z}$, $\mathbb{R}/\mathbb{Z}$ and $\mathbb{R}$ . . . 29
2.1.2 Asymptotics . . . 31
2.1.3 Support and convexity . . . 31
2.1.4 Pedestrian matters . . . 32
2.2 Diophantine approximation . . . 32
2.3 Basics on norms in analysis . . . 33
2.3.1 Norms and the inner product . . . 33
2.3.2 The duality principle for linear operators . . . 34
2.3.3 A few words on derivatives and integrability . . . 36
2.4 The Fourier transform . . . 38
2.4.1 The Fourier transform: definition and basic properties . . . 38
2.4.2 The Fourier transform in general . . . 41

2.5 The Mellin transform . . . 43
2.5.1 Basic properties . . . 43
2.5.2 The Mellin transform and Dirichlet series . . . 45
2.6 Complex-analytic tools . . . 46
2.6.1 Writing a function in terms of its zeros . . . 46
2.6.2 Phragmén-Lindelöf. Hadamard's three-line theorem. . . . 49

3 Series and summation **51**
3.1 Summation formulae . . . 51
3.1.1 Sweet memories of childhood . . . 51
3.1.2 The Euler-Maclaurin formula . . . 52
3.1.3 Summation by parts and Abel summation . . . 55
3.1.4 The Poisson summation formula . . . 56
3.2 Exponential sums . . . 57
3.2.1 A first arbitrary-order estimate . . . 57
3.2.2 Vinogradov meets Poisson and Euler . . . 58
3.3 Harmonic sums . . . 60
3.4 The Gamma function . . . 62
3.4.1 Basic theory . . . 62
3.4.2 The digamma function . . . 66
3.5 The Riemann zeta function . . . 67
3.5.1 Definition. Analytic continuation and functional equation. . . 68
3.5.2 Approximating $\zeta(s)$. . . . 70
3.5.3 Zeros of $\zeta(s)$. . . . 71
3.5.4 Growth of $\zeta(s)$ . . . 73
3.5.5 Writing $\zeta(s)$ in terms of its zeros. Special values. . . . 75
3.6 Dirichlet characters . . . 76
3.6.1 Orthogonality. Primitive and imprimitive characters. . . . 76
3.6.2 Multiplicative and additive characters . . . 77
3.6.3 Ramanujan sums . . . 79
3.7 Dirichlet L functions . . . 81
3.7.1 Definition. Analytic continuation and functional equation. . . 81
3.7.2 Approximating $L(s,\chi)$. . . . 82
3.7.3 Zeros of $L(s,\chi)$. . . . 83
3.7.4 Writing $L(s,\chi)$ in terms of its zeros. Special values. . . . 86

4 Computational matters **89**
4.1 Interval arithmetic . . . 90
4.1.1 Finding roots and extrema . . . 92
4.1.2 Automatic and symbolic differentiation . . . 94
4.1.3 Numerical integration . . . 94
4.2 Special functions . . . 96
4.2.1 The error function erf . . . 97
4.2.2 Incomplete gamma functions . . . 98
4.2.3 Parabolic cylinder functions . . . 98

4.3 Explicit methods for L functions . . . 99
4.3.1 Finding zeros . . . 100
4.3.2 Computing $L(s, \chi)$ . . . 101
4.4 Calculating Euler products . . . 103
4.4.1 Accelerating convergence by products of $\zeta(s)$ . . . 104
4.5 The sieve of Eratosthenes and its variants . . . 105
4.5.1 A segmented sieve of Eratosthenes . . . 106
4.5.2 Further improvements: shorter segments . . . 109
4.6 Verifying Goldbach's conjecture for small integers . . . 111
4.7 Automated theorem proving and completeness . . . 113

5 Basic sums of arithmetical functions 116
5.1 Sums over square-free numbers . . . 117
5.2 Sums over primes . . . 121
5.2.1 Bounds on $\psi(x)$ and $\vartheta(x)$ . . . 121
5.2.2 Bounds on general sums over primes . . . 123
5.3 Sums of μ . . . 128
5.3.1 Bounds on sums of μ for large x . . . 129
5.3.2 Bounds on sums of μ for x bounded . . . 132
5.3.3 Convexity. Bounds on sums of μ for all x . . . 136
5.3.4 Coprimality conditions . . . 138

II Sieves large and small 144

6 Sums used in sieve theory 145
6.1 Sums of $\mu^2(n)/\phi(n)$ . . . 146
6.1.1 Elementary bounds . . . 147
6.1.2 Further elementary estimates: the convolution method . . . 148
6.2 A smoothed sum of $\mu(n)/\sigma(n)$ . . . 151
6.2.1 The case of x bounded . . . 152
6.2.2 Bounds for x arbitrary . . . 153
6.3 Definition of $g_v(y_1, y_2)$. Possible approaches. . . . 157
6.4 The finite sum $g_v(y_1, y_2)$ and the infinite sum $h_v(y_1, y_2)$ . . . 160
6.5 Bounds on $\mathbf{h}_v$ . . . 161
6.5.1 Bounds on $\mathbf{h}_v(y_1, y_2)$ for y_1, y_2 small . . . 162
6.5.2 Bounds on $\mathbf{h}_v(y_1, y_2)$ for y_1, y_2 small or moderate . . . 163
6.5.3 Bounds on $\mathbf{h}_v(y_1, y_2)$ for y_1, y_2 large . . . 167
6.5.4 Bounds on $\mathbf{h}_v(y_1, y_2)$ for y_1 large or moderate and y_2 small . . . 171
6.6 Computing h_v for small arguments . . . 173
6.6.1 Computing $h_v(y_1, y_2)$ for y_1, y_2 small . . . 173
6.6.2 Computing $h_v(y)$ for y small or moderate . . . 177
6.7 Excursus on the Dress-Iwaniec-Tenenbaum constant . . . 185

7 A natural upper-bound sieve 190

7.1 Introduction . . . 190
7.2 Separating the main term and the remainder . . . 194
7.3 Explicit bounds on a sum involving μ: general plan . . . 201
7.4 Tail terms and cross-terms . . . 202
7.5 Estimating the main term . . . 209
7.6 Main-term totals . . . 223
7.7 Remainder terms . . . 230
7.8 Conclusion . . . 239
7.8.1 Proof of main result . . . 239
7.8.2 Final remarks . . . 242

8 The large sieve: smoothing and scattering 243
8.1 The large sieve and smoothing . . . 244
8.2 Scattering: tails and primes . . . 251
8.3 Using different kinds of scattering . . . 254

9 The L^2 norm and the large sieve for primes 258
9.1 Introduction . . . 258
9.2 The large sieve for primes and its analogue for an integral . . . 259
9.3 Bounding the quotient . . . 263
9.4 Conclusions . . . 271

III Minor arcs 274

10 Introduction 275
10.1 Results . . . 276
10.2 Basic setup . . . 277
10.2.1 Vaughan's identity with weights . . . 277
10.2.2 Estimating type I and type II sums: an outline . . . 280
10.3 Comparison to earlier work . . . 281
10.3.1 An alternative route . . . 282

11 Type I sums 285
11.1 Overview . . . 286
11.2 Trigonometric sums . . . 289
11.3 The contribution of the zero modulus . . . 298
11.4 Cycling through moduli efficiently . . . 302
11.4.1 A short type I sum: $S_{I,1}$ . . . 303
11.4.2 The basic sum of type I . . . 305
11.5 The triple sum $S_{I,2}$ . . . 311
11.5.1 A suboptimal bound on $S_{I,2}$ . . . 312
11.5.2 Terms with m divisible by q . . . 312
11.5.3 A bound on $S_{I,2}$ for q small . . . 315

12 Type II sums: using small and large sieves **318**
12.1 The type II contribution 320

13 Minor-arc totals **337**
13.1 The case of small denominator 338
13.1.1 Choosing UV 338
13.1.2 Other parameters 340
13.1.3 Bounds 342
13.2 The case of large denominator 358
13.2.1 Parameters 358
13.2.2 Bounds 359
13.3 Conclusion 368

IV Major arcs **376**

14 Major arcs: overview and results **377**
14.1 Results 378
14.2 Main ideas 381
14.2.1 Explicit formulae 381
14.2.2 Choosing smoothing functions 382

15 The Mellin transform of the twisted Gaussian **383**
15.1 Overview 383
15.1.1 Results 383
15.1.2 Relation to the previous literature 385
15.2 How to choose a smoothing function? 386
15.2.1 The method of stationary phase 386
15.2.2 An uncertainty principle for the Fourier and Mellin transforms 387
15.2.3 Conclusions. Choice of smoothing function 390
15.3 The twisted Gaussian: overview and setup 391
15.3.1 Parabolic cylinder functions 391
15.3.2 Estimates and behavior 394
15.4 The saddle point 395
15.4.1 The saddle-point method 395
15.4.2 Finding the saddle point 396
15.4.3 The coordinates of the saddle point 397
15.4.4 The direction of steepest descent 398
15.5 The integral over the contour 400
15.5.1 Approximating $\Re\phi(u)$ 402
15.5.2 Integral estimates 404
15.5.3 The case $\delta < 0$ 407
15.5.4 The case $\delta > 0$ 413
15.6 Conclusion and final remarks 420

16 Explicit formulae **421**
16.1 A general explicit formula 422
16.1.1 The basic explicit formula 422
16.1.2 The residue at $s = 0$ 426
16.1.3 The integral for $\Re s = -1/2$. 427
16.1.4 Explicit formula, second version 429
16.1.5 Bounding $b(\chi)$, or $B(\chi)$, or $L'(1,\chi)/L(1,\chi)$. 430
16.1.6 Bounding the sum over non-trivial zeros 433
16.1.7 Explicit formula, third version 438
16.2 Explicit formulae for some smoothing functions 439
16.2.1 Decay and norms for the Gaussian 439
16.2.2 The case of $\eta_+(t)$ 446
16.3 Applying GRH(T). Conclusions. 449

V The integral over the circle **455**

17 The integral over the major arcs **456**
17.1 Decomposition of S_η by characters 457
17.2 The integral over the major arcs: the main term 459
17.3 The L^2 norm over the major arcs 462
17.4 The integral over the major arcs: conclusion 467

18 Optimizing and adapting smoothing functions **471**
18.1 The symmetric smoothing function $\eta_\circ$ 471
18.1.1 The product $\eta_\circ(t)\eta_\circ(\rho - t)$. 472

19 The integral over the minor arcs **474**
19.1 Putting together L^2 bounds over arcs and L^∞ bounds 474
19.2 The minor-arc total 477

20 Conclusion **487**
20.1 The L^2 norm over the major arcs: explicit version 487
20.2 The total major-arc contribution 489
20.3 The minor-arc total: explicit version 495
20.4 Conclusion: proof of main theorem 503

VI Appendices **505**
A.1 The functions η and η_1 506
A.2 The functions $\eta_\circ$, η_+, h and h_H 515
A.2.1 Definitions and basic properties 515
A.2.2 The Mellin transform Mh 518
A.3 Norms of $\eta_\circ$ and η_+ 520
A.3.1 The difference $\eta_+ - \eta_\circ$ in L^2 norm. 520

A.3.2 Norms involving $\eta_\circ$ and η_+ 521
A.3.3 Norms involving η'_+ 523
A.3.4 The L^∞-norm of η_+ 527
B.1 Sums over primes with smoothing 528
B.2 Sums involving ϕ 533

Bibliography **537**

Index **560**
